This chapter reviews the separate emergences and developments of modern cell biology and molecular biology before making tentative suggestions about how technologies and research interests since the 1970s led to more direct contacts and interactions between the two fields. As the developments of the two fields, particularly that of molecular biology, had been well studied by historians, each ...

A variety of molecular structures are utilized in recombination, including molecules with single-strand gaps, single-strand overhangs and double-strand breaks (2– 4). These substrates are processed via similar mechanisms in all DNA-based life forms, from various recombination events in prokaryotes, their plasmids and phages, to meiotic crossing-over in eukaryotes. Studies on the ...

Cell biology is a branch of biology studying the structure and function of the cell, also known as the basic unit of life. Cell biology encompasses both prokaryotic and eukaryotic cells and can be divided into many sub-topics which may include the study of cell metabolism, cell communication, cell cycle, biochemistry, and cell composition. The study of cells is performed using several ...
