Photographers have struggled to master the techniques of infrared photography for years and many have been put off even trying because of the mystique behind the subject.

[Creative Infrared Photography: Capture to Print](#)

Infrared light starts right after the red light of visible spectra and is, therefore, invisible to us. In infrared photography, the sensor (or the film) reacts to infrared light while a filter will cut all visible and UV light. For the kind of infrared photography we are interested in, we use the so called near-infrared light (see image above).

[Digital Infrared Photography - Nature Photography Central](#)

In infrared photography, the film or image sensor used is sensitive to infrared light. The part of the spectrum used is referred to as near-infrared to distinguish it from far-infrared, which is the domain of thermal imaging. Wavelengths used for photography range from about 700 nm to about 900 nm. Film is usually sensitive to visible light too, so an infrared-passing filter is used; this lets ...
